The Student Cycle

Every CS student knows this loop

1. **Stuck on** problem
2. **Google the** solution
3. **Copy-paste** code
4. **Submit.** "Accepted"
5. **Next problem.** Same struggle.

Repeat forever...

You never actually LEARN.

HintCode

Smart Coding Hints for Students

A Chrome extension that reads your code, finds the exact bug, and nudges you to fix it yourself.

Progressive hints - not solutions.

5	3	0
Platforms	Hint Levels	Data Collected

No servers. No tracking. No subscriptions.

Just you, your code, and better hints.

github.com/saiteja181/hintcode

How It Works

From stuck to solved in 4 steps

{}

DETECT

HintCode reads your code
+ problem from the page

?

HINT 1

Gentle nudge about your
specific bug

!

HINT 2

Names the technique.
Points at buggy lines.

*

HINT 3

Step-by-step guide.
Edge cases. No code given.

Last resort: Full solution (only if you ask twice)

Code-Aware Hints

Not generic advice. YOUR code. YOUR bug.

max_subarray.py | LeetCode #53

```
1   def maxSubArray(self, nums):
2     m    = 0                                    BUG
3     cur      = 0
4     for      n in nums:
5       cur          += n
6       if          cur > m:
7         m            = cur
8       if          cur < 0:
9         cur            = 0
10    return      m
```

HintCode detects the bug and says...

HINT 1 - NUDGE

Your line 2 sets m = 0.

What happens when ALL numbers in the array are negative?

Try: nums = [-3, -1, -5]
What would your function return?

No algorithm names. No solution.

Just enough to make you THINK.

ChatGPT / Google

"Use Kadane's algorithm. Here is the code..."

You learned nothing.

HintCode

"Your line 2 fails when nums = [-3, -1, -5]"

You fix it yourself.

3 Levels of Help

Escalate only when you need to

LEVEL 1: NUDGE

Your line 2 sets m = 0. What happens when all numbers in the array are negative?

Try nums = [-3, -1, -5]. What does your function return vs what it should return?

Still stuck? Escalate.

LEVEL 2: APPROACH

This is Kadane's Algorithm. Your m = 0 reset loses the "least negative" answer.

Instead of 0, what should m start as to handle the all-negative case correctly?

Need more detail?

LEVEL 3: DETAILED GUIDE

Line 2: Initialize m = float('-inf') not 0.
Line 3: cur stays correct.
Line 6-7: Your comparison logic is fine.
Line 8-9: When cur < 0 you reset. Good.

Edge case: [-1] should return -1, not 0.
Fix line 2, keep everything else.

Works Everywhere

5 platforms. Auto-detection. Zero config.

LC — **LeetCode**
Most popular for interviews
Auto

HR — **HackerRank**
Used by companies for hiring
Auto

CF — **CodeForces**
Competitive programming
Auto

CC — **CodeChef**
Indian CP community
Auto

GFG — **GeeksforGeeks**
Practice + theory
Auto

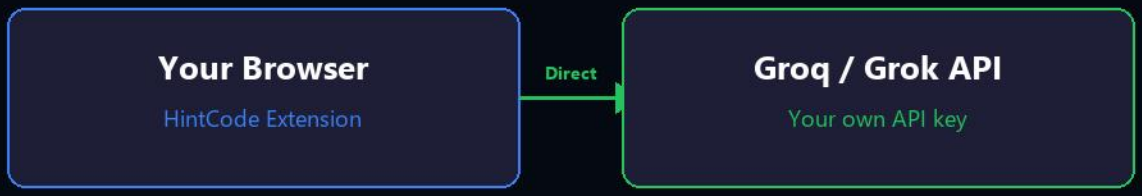
Auto-detects problem, code, and language

Works with Monaco, CodeMirror, ACE editors

Manual mode available for any other site

Privacy First

Your code stays YOUR code



NO middleman server

- **No backend server**
  API calls go directly from your browser to AI
- **No data collection**
  Zero analytics. Zero telemetry. Zero tracking.
- **BYOK model**
  You provide your own free API key
- **Fully open source**
  Audit every single line of code on GitHub
- **Encrypted storage**
  API key in Chrome's encrypted sync storage

Other AI tools
Send your code to their servers
Track usage. Sell data.

HintCode
YOUR key. YOUR browser.
Nothing leaves your machine.

Setup in 2 Minutes

Free. No credit card. No signup.

1 Download from GitHub

Clone repo or download ZIP
github.com/saiteja181/hintcode

2 Load in Chrome

chrome://extensions
Enable Developer Mode
Click "Load unpacked"

3 Get free Groq API key

console.groq.com/keys
No credit card needed
Copy the key

4 Paste key & start!

Click extension > Settings
Paste key > Save > Test
Go to LeetCode > Get hints!

Total time: ~2 minutes

"The struggle is where learning happens."

Stop copying.
Start learning.
